

Elder Council — Quickstart

Convene the council. Keep the dissent. Own the decision.

1. Install

`pip install eldercouncil` (ships no keys — bring your own LLM)

2. See a council decide (keyless)

`eldercouncil convene code-council --demo --question "merge a diff with a hardcoded AWS key"`

3. Wire it into your agent

`eldercouncil init` (guided), or `eldercouncil install claude-code --all`

4. What you get

A pre-tool gate that asks you to convene the right council on high-risk actions; the councils run on your agent's own models; every verdict, vote, and dissent is recorded to `.council/`.
