Elder Council Harness

Don't let one model decide alone.

The problem

When one model reviews your code, triages your alerts, vets your dependencies, scores your risk — and weighs your bet-the-business calls — its blind spots stop being an isolated bad answer and become a repeatable pattern inside your decision infrastructure — a systemic single point of failure.

The response: selective plurality

Use a single agent or a deterministic tool where that is enough; convene a structured, multi-lens council only when a decision is consequential, uncertain, adversarial, or expensive to get wrong. A risk gate (impact x likelihood, 1-25) decides when.

Eight councils

Six cyber — Code, Threat Hunting, Supply Chain Audit, Multi-Jurisdictional Compliance, Cyber Risk, Platform Architecture — plus a general Business Decision council for executive calls and an Engineering Team council for everyday design reviews. Each convenes independent lenses, combines their votes under fail-closed rules, preserves dissent, and records a tamper-evident audit entry.

Honest by design

A council is decision support, not a guarantee. Councils can be wrong. A named human owns every critical and risk-acceptance decision. The audit is tamper-evident, not tamper-proof. The harness ships no keys — bring your own LLM. Council output is model-generated and is not legal, regulatory, or compliance advice.
